cereal grain. Weather damage is caused by the action of hydrolytic enzymes, e.g. amylases, in the grain endosperm. These enzymes accelerate the breakdown of starch granules and protein in the endosperm of germinating grain. Individual growers can identify areas of sprouting prior to harvest, preventing contamination of sound wheat by weather damaged wheat. The damaged grain can be harvested separately from the sound grain and financial losses resulting from down grading the whole crop can be avoided. The two-site immunoassays can be applied at mill or silo (elevator) receival of grain or can be used on farms with minimal
                                                                                                         The present sequence represents an epitope from the wheat alpha-amylase Antibodies which recognise the epitope are used in a two-site immunoassay for qualitative or quantitative detection of alpha-amylase in a test sample. The assay is used for detecting weather damage in a
                                                                                                                                                                                 Two site immunoassay for the qualitative or quantitative detection alpha-amylase in a test sample, used to detect weather damage in a cereal grain, such as wheat, rye, triticale or barley -

                                                                                                                                                                    The present sequence represents a wheat alpha-amylase. Antibodies which recognise epitopes from this protein are used in a two-site immunoassay for qualitative or quantitative detection of alpha-amylase in a test sample. The assay is used for detecting weather damage in a cereal grain. Weather damage is caused by the action of hydrolytic enzymes, e.g. amylases, in the grain endosperm. These enzymes accelerate the breakdown of starch granules and protein in the endosperm of germinating grain. Individual growers can identify areas of sprouting prior to harvest, preventing contamination of sound wheat by weather damaged wheat. The damaged grain can be harvested separately from the contamination of firm of the contamination of sound wheat by meather the damaged grain can be harvested separately from the
                                                                                                                                                                                                                                                                                                                               sound grain and financial losses resulting from down grading the whole crop can be avoided. The two-site immunoassays can be applied at mill or silo (elevator) receival of grain or can be used on farms with minimal
                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2000-376655/32

The polynucleotides are used to modify the activity of a polypeptide involved in a polysaccharide biosynthetic pathway in the plant. They are especially used to modulate or alter the polysaccharide content, composition or structure of the plant. AAB16268 to AAB16340 are proteins encoded by some of the polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eucalyptus grandis; pinus radiata; Monterey pine; modification; plant cell wall; polysaccharide; polysaccharide biosynthetic pathway; transgenic plant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a gene expression system containing the promoter region of an alpha-amylase gene; also described is a method for preparing a transgenic rice plant comprising: (1) infecting Agrobacterium into an unmatured embryo of a rice plant; (2) simultaneously culturing the embryo with a suspended culture of a dioctyledon during the transforming step; (3) growing the transformed embryo to a callus in a selective medium containing a plant growth hormone; and (4) regenerating the callus to roots and sprouts in a regeneration medium. The method can be used for mass production of a desired gene product in a plant host cell. The present sequence represents the rice alpha-Amy7-C protein, which is used in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of rice (Oryza sativa) cv. M202
Calpha-amylase, encoded by isolated genomic DNA clone alpha-Amy7-C
C (see AAI70537). Expression of alpha-Amy7-C in cultured suspension
C cells of rice was induced 6-fold at day 12 after sugar depletion,
C and continued to increase up to day 14. The invention relates to
C the use of an alpha-amylase gene promoter and signal sequence in
C transgenic plant seeds. In a claimed method, a transgenic monocot
C is obtained by: transforming a nimmature embryo of the plant via
C alpha-amylase promoter (e.g. the rice alpha-Amy7-C promoter) that
C is induced under sugar-depleted or sugar-free conditions, a signal
C peptide sequence, and an exogenous sequence encoding a gene product;
C regenerating the transformed plant; and growing the transgenic
C sugar-free conditions. The gene product may also be obtained by
C cultivating an angiosperm host cell. The transgenic monocot plants

DNA encoding the signal peptide of alpha-amylase and the promoter along with the glucuronidase reporter gene and hygromycin resistance gene are used in the construction of a GUS gene expression vector, which when transformed into rice suspension-cultured cells, can be used to investigate the expression of the vector under the control of the promoter. The gene expression system can be used to conduct gene regulation and protein expression and secretion using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene expression system comprising the promoter region of alpha-amylase gene, produces large quantities of alpha-amylase in culture medium of sugar starved rice - \,

The promoter regions of these amylase genes are used in a new gene expression system. The system may be used for the expression of heterologous genes in plant cells and for the large scale production of the encoded products of such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 3; Page 27-30; 42pp; Japanese.

Other genes which may be inserted into the virus are those which control a phenotypic trait, such as male sterility, or sequences encoding anti-sense RNA which can be useful to prevent the expression of undesired phenotypic traits. The recombinant virus is derived from a plus sense, single stranded virus selected from tobamovirus, brome mosic virus, rice necrosis virus or a genin virus.

The coding sequence was inserted into a recombinant plant viral nucleic acid which was then used to express a recombinant product (in this case rice alpha-amylase) in a plant. The plant viral sequence may be from tobacco mosaic, cucumber green mottle, cowpea mosaic, brome mosaic, broad bean mottle, rice necrosis, geniniviruses, tomato golden mosaic, Cassava latent and

These heterologous sequences are preferably under the control of the native promoter sequence. By using a plant virus existing cells can be altered with a new coding sequences without involving germ cell. The recombinant viruses are stable and can cause systemic infection, with stable expression/transcription in plants that are hosts for the non-native part of the vector. The nucleotide sequences encoding these protein preferably integrated in plant viruses having either the O-coat protein or the UI-coat

The nucleic acid sequence can be expressed in the plant viral constructs of the invention. The specification describes a recombinant plant viral nucleic acid derived from a positive (+)-sense RNA plant virus comprising a native (+)-sense RNA plant virus promoter that is linked to an expression sequence and a heterologous (+)-sense RNA plant virus promoter that is linked to an expression sequence. The promoters are incapable of recombination with each other, and one of the expression sequences encodes a plant viral coat protein while the other is optionally a heterologous coding sequence. The plant viral nucleic acid is capable of systemic infection in a host plant. The viral construct is useful for the introduction and expression of non-viral foreign genes in plants and the production of e.g. potential AIDS therapeutic drugs.

CC from a plus sense, single stranded RNA plant viral nucleic acid derived crown a plus sense, single stranded RNA plant virus. The recombinant plant crown a plus sense, single stranded RNA plant virus and promoter comparison acid comprises: (a) a first plant viral subgenomic promoter coperably joined to a first nucleic acid expression sequence; and (b) a second plant viral subgenomic promoter that is non-native and is operably of the second nucleic acid expression sequence; where, (i) (a) and (c) are incapable of recombination with one another; (ii) either the first or the second nucleic acid expression sequence is a plant viral comparison of protein coding sequence. The recombinant plant viral nucleic acid cother useful polypeptides or proteins e.g. enzymes, complex biomolecules and ribozymes. It also gives the option of applying the coding sequence coding sequences and is capable of systemic infection in the plant host. The transformation and regeneration of target organisms become

                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel recombinant viral nucleic acid (I) CC from a non-retroviral (+) sense, single stranded animal RNA virus comprising a nucleic acid sequence coding for a viral coat protein CC comprising a nucleic acid sequence coding for a viral coat protein CC nucleic acid sequences regulated by two other subgenomic promoters. CC nucleic acid sequences regulated by two other subgenomic promoters. CC (I) is useful for expressing foreign genes e.g. genes inducing male CC interleukins, EPO (erythropoietin), CSF (colony stimulating factor), CC factor VIII, hGH (human growth hormone), melanin, insulin, vaccines CC etc., and enzymes that are useful for stereo specific catalysis of CC organic compounds. (I) is stable and transcribed systemically. The dual CC subgenomic promoter system reduces the frequency of recombination thus reducing regeneration of the wild type virus. This sequence represents a rice alpha-amylase protein which is described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Amy26 was isolated from a cDNA library prepared from RNA extracted from sprouts of a potato. The library was screened with a barley alpha amylase probe. The nucleic acid sequence encodes a partial alpha-amylase procursor commencing at amino acid residue 133 of the full-length protein.

                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL/1876-ABL/3051), expressed DNA sequences (ABL/1840-ABL/1875) and the encoded proteins (ABB/187737-ABB/2072).
                                                                                                                                                                                                                                                                                                                                                                                                                                      WO200171042-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila melanogaster

                                                            The present sequence is that of alpha-amylase encoded by DNA clone alpha-Amy3-C (See AAT/0540). Expression of alpha-Amy3-C increases 5-fold following sugar starvation. The invention relates to the production of recombinant proteins in transgenic plants and transgenic plant seeds. In a claimed method, a transgenic plants and transgenic plant seeds. In a claimed method, a transgenic monocot is a dyrobacterium-mediated transformation with DNA comprising a plant aprobacterium-mediated transformation with DNA comprising a plant is induced under sugar-depleted or sugar-free conditions, a signal peptide sequence, and an exogenous sequence encoding a gene product; regenerating the transformed plant; and growing the transgenic plant, which expresses the gene product may also be obtained by cultivating an anglosperm host cell. The transgenic monocot plants are especially useful in brewing and to produce glucose from starch.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a gene expression system comprising the alpha-amylase gene promoter. DNA encoding the signal peptide of alpha-amylase and the promoter along with the glucuronidase reporter gene and hygromycin resistance gene are used in the construction of a GUS gene expression vector, which when transformed into rice suspension-cultured cells, can be used to investigate the expression of the vector under the control of the promoter. The gene expression of the vector under the conduct gene regulation and protein expression and secretion using the characteristics of the alpha-amylase gene promoter and the DNA sequence encoding the signal peptide. The present sequence represents an alpha-amylase related protein used in the course of the present reports.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yu S,

CC polypeptide (SP) used in the method of the invention. The SPs can CC polypeptide (SP) used in the method of the invention or survival CC of a cell which expresses the SP. The products can be used to CC modulate spermatogenesis, osteogenesis, chondrogenesis or neuronal cells, e.g. CC modulate spermatogenesis. They can be used for treating e.g. CC cell differentiation or to enhance survival of neuronal cells, e.g. CC degenerative disorders marked by loss of particular cell-types, CC degenerative disorders marked by loss of particular cell-types, CC they can be used to treat neurological conditions derived from CC acute, subacute, or chronic injury to the nervous system, aging of CC acute, subacute, or chronic injury to the nervous system, aging of CC the nervous system chronic inmunological diseases of the nervous system or affecting the nervous system. They can also treat be used to CNS trauma infarction, infection (such as viral infection with CC varicella-zoster), metabolic disease, nutritional deficiency, cor in nerve prostheses for the repair of central and peripheral CC or in nerve prostheses for the repair and regeneration of lung the nervous, pendymonas and for liver repair and regeneration of lung constants.

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57037-ABB72072).

(ABB57037-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence was used for comparison studies with vertebrate Smoothened polypeptides. Smoothened interacts with Hedgehog and Patched signalling molecules involved in cell proliferation and differentiation. Brat Smoothened cDNA was isolated from an embryonic day 9-10 rat cDNA library. The rat smoothened cDNA was then used as a probe to isolate the human homologue from a human embryonic lung cDNA library. Antibodies which specifically bind to the vertebrate smoothened polypeptides were identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibodies to vertebrae smoothened proteins and patched signaling molecules involved in differentiation -

Alzheimer's and Parkinson's disease, cord injury, stroke etc.
Peptide corresponds to AAs 54 to 69 of chicken NGF.
                                                                                                                                                                                                                               Oligonucleotide probes and primers were synthesised based on the NT family including NGF, BDNF and NT-3. These were used to isolate DNA encoding NT-4 from nucleic acid from Xenopus ovaries. This DNA was then used to isolate other mammalian DNA encoding NT-4, including human NT-4 DNA.
                                                                                                                                                               Sequence

```
CC of a proneurotrophin, where PD comprises a pro-domain conserved region, CC or a modified proneurotrophin protein (ID) with a PD, a mature CC onserved region to MD and resistant to protease cleavage. The PD is CC selected from specific peptide fragments of human nerve growth factor (NGF), human brain derived neurotrophic factor (BDNF), human neurotrophin 4/5 (NT4/5). (ID) is useful for inducing CC apoptosis in a cell comprising P75 receptors (normal number or higher CC than the normal number of p75 receptors) on its surface, by causing the P75 receptor to bind (ID), in vitro, in mammals or humans. The method is CC useful for tracating vascular smooth muscle plaque e.g. atherosclerotic CC plaque. The cell is a malignant cell e.g. cells of tumour, melanoma, CC prostate, pancreas, nervous system (e.g. medulloblastoma or astrocytoma), CC leukemia, lymphoma, testicular, lung, brain, malignant oligodendrocyte, heart, vascular smooth muscle or neural cell. A molecule that inhibits CC the binding of proneurotrophin to a p75 receptor is useful in a method CC or inhibiting apoptosis of a cell in a mammal e.g. human suffering from CC condition associated with undesired apoptosis due to binding of a proneurotrophin to p75 receptor. The condition is the result of an injury counsed by a chemical or radiation or occurring during cancer treatment. Howaiic

CC The invention relates to novel human diagnostic and therapeutic CC polynucleotides designated dithp (ACC46049) and to their CC encoded proteins (DITHP; ABR41136-ABR41812). The invention also relates CC to polynucleotide sequences at least 90% identical to the dithp cDNA CC sequences of the invention; recombinant vectors, host cells and transgenic organisms comprising dithp nucleic acid sequences; methods of transgenic organisms comprising dithp nucleic acid sequence; methods of compounds which specifically bind a DITHP protein; and methods of compounds which specifically bind a DITHP protein may be used in the CC assessing the toxicity of test compounds using a dithp hybridisation CC diagnosis of a wide variety of conditions including cancer and other cell proble. Dithp nucleic acid sequences and DITHP proteins may be used in the CC vital, fungal or parasitic infections; hormonal disorders; methodic CC disorders; autoimmune or inflammatory disorders; metabolic CC disorders; and connective tissue disorders. They may also be used to screen for modulators of protein activity or gene expression. DITHP coteins can additionally be used in analysis of the proteome of a tissue CC or cell type and to induce antibodies. The dithp nucleic acids are cell type and to induce antibodies. The dithp nucleic acids are protein scan additionally be used in analysis of the proteome of a tissue of protein scan in madels of human disease or knock in CC protein modification and/or maintenance.

CC The present sequence represents a DITHP protein modification and/or maintenance.

CC The present sequence represents a DITHP protein modification for this patent did not form part of the printed constraint protein modification and/or maintenance.

The present invention relates to a new|method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer (e.g. patients having a familial history of varian cancer markers may be used in the management and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ovarian cancer; marker; cancer; familial history; brain disorder; central nervous system disorder; bacterial meningitis; viral meningitis; halbeimer's disease; parkinson's disease; cerebral oedema; hydrocephalus; brain herniation; inflammation; encephalitis; testicular disorder; nontuberculous granulomatous orchitis; connective tissue disorder; heart disorder; stakenic heart disorder; thereosclerysis; neoplasm; histological type; carcinogenic; ovarian cancer marker.
                                                                                                                                                                                                                                                                                                                                                                                 Assessing whether a patient is afflicted with ovarian cancer, useful ir assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and from a non cancer patient -
                                                                                                                                                                                                                                                                                                                                        Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     testicular disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytoskeleton associated protein; CYSKP-12; cancer; proliferative; autoimmunity; inflammatory, vesicle trafficking; neurological; cardiovascular; cell motility; reproductive; muscle disorder.

Inhibition of GP88 cexpression or action in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing cells. Antagonists to GP88 are used to treat disease associated with increased expression of GP88, particularly cancer but also viral infections. Fragments of GP88 are used to raise specific viral infections. Fragments of GP88 are used to raise specific delivering toxins or other compounds to GP88-expressing cells) and to screen for antibodies. Methods are provided for diagnosing disease, or determining susceptibility to disease, resulting from altered GP88 are typed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                     The invention relates to a method for diagnosing tumourigenicity in a human. The method comprises obtaining a biological sample containing cells from the patient, detecting GPB8 in the cells of the sample, and determining the number of GPB8 positive cells in the sample, and determining the ratio of GPB8 positive cells to the total number of cells in the sample. The invention also relates to a method for determining if a human patient is resistant to the antineoplastic effects of anticestrogen therapy. The method is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the sample contains less than 10 % GPB8, or less than 5 % GPB8 positive cells. The present sequence is human granulin/epithelin precursor (GPB8) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Fig 9B; 50pp; English.

NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:

STREET:

Chicago

Illinois

ADDRESSEE:

E: Marshall, O'Toole, Gerstein, Murray & Borun 6300 Sears Tower, 233 South Wacker Drive

COUNTRY: STATE:

RY: United States of America 60606-6402

```
APPLICANT: Yu, Su-May
APPLICANT: Liu, Li-Fei
TITLE OF INVENTION: Gene Expression System Comprising the
TITLE OF INVENTION: Promoter Region of the Alpha-Amylase Genes
                                                                                                                                     TITLE OF INVENTION: Gene Expression System Comprising the TITLE OF INVENTION: Promoter Region of the Alpha-Amylase Genes NUMBER OF SEQUENCES: 7
